Education

University of Guelph — Bachelor of Computing, Computer Science (Co-op)

Guelph, ON

Specialization in Cybersecurity · 2025 – 2030

Technical Skills

Languages: TypeScript, Python, C, JavaScript, Java, SQL, Bash

Systems & Infra: Linux, Docker, GitHub Actions CI/CD, AWS (EC2, S3, IAM), Terraform, pthreads, BSD sockets

Security & Observability: IAM policy analysis, SARIF, Prometheus/Grafana, ELK (Logstash/Kibana), PostgreSQL, FastAPI/Flask, pytest

Experience

Software Engineering Intern — Vibez Music

Toronto, ON

Jan 2026 – Apr 2026

- Improved internal system throughput by 40%+ by designing and deploying Python-based backend services and automation tooling to eliminate manual operational bottlenecks.
- Reduced incident triage time by implementing strict request validation, structured JSON logging, and standardized error handling, improving observability and debugging efficiency.
- Owned backend delivery pipelines by integrating CI/CD workflows and maintaining reliable service deployments used by cross-functional teams.

Freelance Web Developer — Self-Employed

Remote

Jun 2024 – Present

- Delivered 4+ production-grade web systems end-to-end, handling system design, performance optimization, and deployment.
- Optimized frontend and backend performance to achieve 95-100 Lighthouse scores through asset tuning, caching strategies, and efficient resource loading.

Projects

Agent Seatbelt | TypeScript, CLI, Policy Engine

Apr 2026 – Present

- Built a runtime firewall for AI coding agents that intercepts shell, repo, secret, and production-bound actions before execution.
- Implemented deterministic risk classification, approval gating, session receipts, and hash-chained audit trails for local DevSecOps workflows.

Permission Guard | TypeScript, AWS IAM, SARIF

Apr 2026

- Shipped a local-first CLI (npm: @kenjiifx/permissionguard) that scans AWS IAM policies for overly broad permissions and scores risk.
- Generated safer, reviewable remediation candidates and SARIF findings suitable for CI and code scanning pipelines.

SSH Honeypot & Threat Analytics | AWS, Docker, ELK, Python, Terraform

Dec 2025 – Jan 2026

- Deployed a cloud-based SSH honeypot on AWS to capture and analyze real-world attack traffic in a controlled environment.
- Processed and analyzed 5,000+ attack events using Python and the ELK stack to identify attacker behaviors and command execution trends.
- Provisioned infrastructure with Terraform, enforcing least-privilege IAM policies and secure cloud deployment practices.

Certifications

AWS Certified Cloud Practitioner — In Progress · Amazon Web Services

CCNA — In Progress · Cisco
