EDUCATION

University of Guelph

Bachelor of Computing, Computer Science (Co-op), Specialization in Cybersecurity

Guelph, ON

2025 – 2030

TECHNICAL SKILLS

Languages: C, Python, Java, SQL, Bash, JavaScript

Systems & Infra: Linux, Docker, GitHub Actions CI/CD, AWS (EC2, S3, IAM), Terraform, pthreads, BSD sockets

Observability: Prometheus/Grafana, ELK (Logstash/Kibana), PostgreSQL, FastAPI/Flask, pytest

EXPERIENCE

Vibez Music

Software Engineering Intern

Remote

Jan 2026 – Present

- Increased internal workflow throughput by **40%+** by shipping internal Python tooling and backend services across Flask services to eliminate manual handoffs.
- Reduced incident triage time by enforcing request validation, structured JSON logging, and consistent error contracts, improving reproducibility and root-cause speed.
- Shortened feature delivery cycles by owning backend changes through CI/CD and publishing integration docs consumed by iOS engineers.

Self-Employed

Freelance Web Developer

Remote

Jun 2024 – Present

- Delivered **4+** client sites end-to-end by scoping deliverables, building responsive UI, and producing handoff documentation for maintainability.
- Achieved **95–100** Lighthouse scores by profiling render-blocking assets, compressing images, and tuning cache-control headers.

PROJECTS

Threat Detection Pipeline | Python, PostgreSQL, Prometheus, Grafana

Feb 2026 – Present

- Built a real-time detection pipeline ingesting system logs and SSH events, storing structured data in **PostgreSQL** for analysis.
- Implemented anomaly detection to flag suspicious login patterns and brute-force attempts, triggering automated alerts on threshold breaches.
- Instrumented system metrics using **Prometheus** and visualized attack activity and system health via **Grafana** dashboards.

Multithreaded HTTP Server | C, Sockets, Pthreads

Jan 2026

- Built an HTTP/1.1 server in C using BSD sockets and a pthread thread pool, enabling concurrent client handling under parallel load.
- Ensured memory safety by validating zero memory leaks with **Valgrind** and stress-testing performance under concurrent requests.

SSH Honeypot & Threat Analytics | AWS, Docker, ELK, Python

Dec 2025 – Jan 2026

- Deployed a cloud-hosted SSH honeypot on **AWS** to capture live attack traffic and transform syslog events into structured records via Logstash.
- Analyzed **5,000+** attack events using Python and Kibana dashboards to identify attacker patterns and command-frequency trends.
- Provisioned infrastructure with **Terraform**, enforcing least-privilege IAM policies and secure deployment practices.

CERTIFICATIONS

AWS Certified Cloud Practitioner

Amazon Web Services

In Progress
